Mechanical cell  
stimulation

# MECHANOTRANSDUCTION

The Stimulation of human and animal cells by mechanical impulses has been successfully used in medicine for decades.

By mechanotransduction (the transmission of mechanical stimuli), we can activate cells, reduce inflammation, stimulate metabolic processes, and decrease muscular tension.

## evocell® II

Treatment with evocell is painless and possible in a relaxed lying posture, sitting or standing. Rhythmic impulses stimulate the mechanical transduction of the body and activate a cascade of physiological processes.

- Pain reduction
- Relaxation of the musculature
- Fasten regeneration
- Swelling reduction
- Stress reduction

## APPLICATION AREAS

evocell is designed to be applicable in numerous cases, including:

- Chronic unspecific back pain
- In combination with physiotherapy (e.g., heat, massage, manual therapy)
- As a preparatory or regenerative tool for athletes
